❓ QUESTION 1 – In Java you must declare variables before using them.
what does it mean to declare a variable?
- Declaring a variable in Java means specifying its **data type** and **name** so the compiler can allocate memory.

❓ QUESTION 2 – Write one line of code showing how to declare an integer variable named number.
- int number;

❓ QUESTION 3 – What happens if you store the user's name in a variable declared as an integer?
If you store a user's name in an integer variable, Java will produce a **compilation error** ❗ since an int can only hold numeric values.
